Past Performance and Successes

- Laboratory Instrument Interfaces**
 2001 - 2008 Design, implement, and support a laboratory instrument communication sub-system providing real-time bi-directional communication and control of 100+ laboratory instruments from multiple vendors. System provided an interface between the laboratory instrument and an Oracle database. This is a production system with a 24x7 operational requirement.
- Vendor Registration Web Portal**
 2007 — Design and implement a web based vendor registration portal that provides registration and approval process, upload and storage of vendor certificate images, NIGP code selection, email status notifications, and ad-hoc query/reporting of vendor database entries. Content management capabilities allow administrative personnel to make site updates on demand.
- Laboratory result data management**
 2007 — Design, implement, and support a laboratory result management system. The system provides electronic data feeds to and from client organizations for retrieval of testing requirements and dispersal of test results. The system maintains a historical record of patient test results to allow charting of an individual's results over time. The system includes generation of end-user client reports customized to the client organization. The system is implemented as a secure intra-net web site.
- Data transformation and formatting**
 2001 — Design, implement and support a data reporting system that provides client specific data formatting for electronic delivery to client information systems. The system allows transmission of results to multiple end systems, requiring each set of results to undergo multiple data transformations. The system provides scripting capability to allow customization of the data transformation without the need to update the process executable image.
- Equipment Lease Application web site**
 2006 — Design and implement a secure web site to collect and process equipment lease applications. The site provides an administrative backend allowing for application processing workflow. The site provides a number of security measures to control and track access to application data. Customizable email notifications keep the lease applicant notified of application status. Content management functionality allows administrative personnel to update the site and provide customized content for each equipment vendor linking to the site.
